

Dear Reader:

Enter the “filenames” of the dominant and non-dominant side of the each participant in “parentheses” (e.g., Data1 = importdata(‘MAX_S1_R_Pelvis-Trunk Ang&AngVel.xlsx’) **OR** Data1 = importdata(‘MAX_S1_L Pelvis-Trunk Ang&AngVel’)) for different movement distances (18participant * 3 distance conditions=54 files). They have been uploaded in a supplementary file named “Dataset” and <https://dataverse.harvard.edu/dataset.xhtml?persistentId=doi:10.7910/DVN/MOEMQG>

In addition, we have placed code that can be run directly (crp_dominant & crp_non_dominant) in supplementary file named dominant & non-dominant in Dataset Folder. "temp_all" is the result of the crp curve for all participants at different movement distances.

Tips: The code and dataset files need to be run in the same folder with MATLAB R2022b.

The original code for crp is as follows:

```
clear all;close all;clc
%%

Data1 = importdata('.xlsx');
Data2 = importdata('.xlsx');
Data3 = importdata('.xlsx');
Data4 = importdata('.xlsx');
Data5 = importdata('.xlsx');
